Standard Operating Procedure (SOP): Cargo Condition & Route Risk Escalation

Version: 1.0 | Effective Date: Sep 2026 | Confidentiality: Internal Operations Only | Companion to: Cold_Chain_Incident_SOP_v2.md

1. Cargo Condition Monitoring

Every shipment leg reports a **Cargo Condition Code** (CGO_COND_CD) captured from in-trailer sensors (shock, humidity, and seal-integrity readings). Dispatch must treat this field as a leading indicator distinct from temperature, since a load can be in-range on temperature while still failing on physical condition.

- **Code = OK:** No action required; continue standard transit monitoring.
- **Code = DAMAGED:** Cargo integrity has been compromised in transit (e.g., seal break, shock event above threshold, or moisture intrusion). Dispatcher must flag the shipment record and notify the receiving facility *before* arrival so an inspection lane is ready.
- **Code = SPOILED:** Immediately treat as a total-loss candidate. Do not proceed to the original delivery point. Reroute to the nearest FDE claims-processing depot and open a cargo-loss claim within 2 business hours.

2. Route Risk Index Escalation

The **Route Risk Index** (RT_RSK_IDX) is a composite score (0.0–10.0) blending live traffic incidents, weather severity, and historical loss rates for the active corridor. It is distinct from the Port Congestion Level and applies to the full route, not just port segments.

- **RT_RSK_IDX < 5.0 (Normal):** No deviation from planned route required.
- **RT_RSK_IDX 5.0–7.5 (Elevated):** Dispatcher must review the corridor for an alternate route and increase driver check-in frequency to every 2 hours.
- **RT_RSK_IDX > 7.5 (Severe):** Mandatory reroute around the flagged corridor segment. If no safe alternate route exists within a 30-minute detour, hold the vehicle at the nearest secure staging area and escalate to the Tier 2 Logistics Manager.

3. Combined Trigger: Damaged Cargo on a Severe-Risk Route

If CGO_COND_CD = DAMAGED *and* RT_RSK_IDX > 7.5 occur on the same shipment, this is classified as a **Compound Incident**. The dispatcher must escalate directly to the Tier 2 Logistics Manager and copy the Regional Safety Officer, bypassing standard Tier 1 triage, since a damaged load on a high-risk corridor carries elevated liability exposure.
